hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid. This has a charge of act least +3 and its N-terminal acylated and/or C-terminal amidated or esterified forms, all of which may contain a disulphide bond to give a cysteine bridge. This peptide is in snake form where all the cysteine residues are replaced by a hydrophobic, small or large polar amino acid (e.g. alanine in this case). Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-fungal agents in plants and animals. The protegrins confer resistance to microbial or viral infection in plants by preventing the growth of a virus or microbe and inactivate the endotoxin of gramnegative bacteria. The protegrins are particularly useful for the treatment of sexually transmitted disease caused by microorganisms e.g. Candida albicans, HIV-1, Chlamydia trachomatis, Treponema pallidum and Neissenia gonorrhoace. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain xxx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula: A1-A2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibacterial; antiviral; antifungal; antibiotic; endotoxin; Candida albicans; gram-negative bacteria; STD; sexually transmitted disease; HIV-1; Chlamydia trachomatis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cationic, antimicrobial, virus-neutralising protegrin peptide(s) useful for the treatment of microbial infection, as food preservatives and in eye care solutions

cc where Al = a basic amino acid; A2 and A3 = a small amino acid; A4 = a basic or small amino acid; A5, A7 and A14 = a hydrophobic amino acid; A5, A1 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; and A18 may be absent or a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino a disulphide bond to give a cesterified forms, all of which may contain a disulphide bond to give a cystene brigher. This peptide is in smake form where all the cysteline brights are replaced by a hydrophobic, small or large polar amino acid (e.g. alanine in this case). Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-fungal agents in plants and animals. The protegrins confer resistance to microbial or viral infection in plants by preventing the growth of a virus or microbe and inactivate the endotoxin of gram-resistance to sexually transmitted disease caused by microorganisms e.g. Candida albicans, HIV-1, Chlamydia trachomatis; Treponema pallidum and Naisseria gonorrhoae. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain anti-biotics and are non-toxic to the cells of higher organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial protegrin; broad spectrum; gram-positive; bacterium; gram-negative; bacteria; yeast; fungus; fungi; protozoa; virus; retrovirus; hrotozoa; virus; reservation; retrovirus; hrophylaxis; treatment; infection; disease; conjunctivitis; keratitis; corneal ulcer; stomach ulcer; STD; Helicobacter pylori; sexually transmitted disease; oral mucositis; respiratory infection; urinary tract infection; MRSA; protozoan; vancomycin resistant Enterococcus; pathogon; multi-drug resistance; pendicillin resistant Staphylococcus pneumoniae; pig; porcine; methicillin resistant Staphylococcus aureus; systemic candidiasis.

                                                                                                                                                                                        The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-postitive and gram-negative bacteria, yeast, fungl, protozoa and certain strains of viruses and retroviruses, e.g. HIV. It can be used to preserve or disinfect a variety of materials, including madical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, conneal ulcers, stomach ulcers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections,
                                                                                                                                                                                                                                                                                                                                                                                          urinary tract infections, systemic candidiasis and oral mucositis, this biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant Enterococcus faecium or faecalis, penicillin resistant Streptococcus penumoniae and methicillin resistant Staphylococcus aureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/Kg/day, by injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antibacterial; antiviral; antifungal; antibiotic; endotoxin; Candida albicans; gram-negative bacteria; STD; sexually transmitted disease; HIV-1; Chlamydia trachomatis; Treponema pallidum; Neisseria gonorrhoeae; eye care; preservative;

The second sequence is a specifically claimed example of a peptide, and the second interests of a specifically claimed example of a peptide, A1-2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

Where A1 = a basic amino acid; A5, A7 and A14 = a hydrophobic amino acid; A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, neutral/polar or small amino acid; A10 and A11 = a basic, neutral/polar or small amino acid; and A18 may be absent or a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid. This has a charge of a least +3 and its N-terminal acylated and/or C-terminal amidated or esterified forms, all of which may contain a disulphide bond to give a cysteine bridge. Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-fungal agents in plants and animals. The protegrins confer resistance to microbe are useful an animals. The protegrins confer resistance to microbe and infactivate the endotoxin of gram-negative bacteria. The protegrins are particularly useful for the treatment of sexually transmitted trachomatis, Treponema pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food, The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antiblotics and are non-toxic to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence is a specifically claimed example of a peptide,

The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula:

Al-A2-A3-A4-A5-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

where A1 = a basic amino acid; A2 and A14 = a small amino acid; A4 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid. This has a charge of a retarlified forms, all of which may contain a disulphide bond to give a cysteline bridge. Peptides of this formula are designated bond to give a cysteline bridge. Peptides of this formula are designated protegrins and are useful as anti-bacterial, anti-viral and anti-imgal agents in comparation of gram-negative bacteria. The protegrins confer resistance to microbal or viral infection in plants by preventing the growth of a virus or microbe are particularly useful for the treatment of sexually transmitted trachments, Treponema pallidum and Neisseria gonoriboeae. They can also be used in eye care solutions and as preservatives for food. The presence of serum) than certain antibiotics and are non-toxic to the alls of the presence of serum) than certain antibiotics and are non-toxic to the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to consult the concrete active agents including crossing the blood-brain barrier.

```
The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, machanisms the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mimmalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                       New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antibacterial; antiviral; antifungal; antibiotic; endotoxin; Candida albicans; gram-negative bacteria; STD; sexually transmitted disease; HIV-1; Chlamydia trachomatis; Treponema pallidum; Neisseria gonorrhoeae; eye care; preservative;

comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, methanisms the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide

specification describes a pharmaceutical composition, which

                                                      The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fungi, protozoa and certain strains of viruses and retroviruses, e.g. HIV.

It can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcres, stomach ulcres associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biooidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant correspondents (Enterococcus pneumoniae and methicillin resistant Staphylococcus cureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/kg/day, by injection.

This peptide represents a linear derivative of the protegrin family of antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The new derivatives are linear and lack the disulphide bridge. The new derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents the chart of the proteins and conlinear active agents the chart of the productions of the passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                  Gaps

where Al = basic amino acid; A5 and A3 = a small amino acid; A4 = a basic or small amino acid; A7 and A14 = a small amino acid; A6 and A18 = a small amino acid; A7 and A14 = a small amino acid; A7 and A14 = a small amino acid; A9, A7 and A14 = a hydrophobic amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A18 may be absent or a basic, hydrophobic or small amino acid; A10 and A18 may be absent or a basic, hydrophobic or small amino acid. This has a charge of at least +3 and its N-terminal acid; and A18 may be absent or a basic, cesterified forms, all of which may contain a disulphide bond to give a reset is anti-bacterial, anti-viral and anti-fungal agents in plants and animals. The protegrins confer resistance to microbe are useful as anti-bacterial, anti-viral and anti-fungal agents in plants by preventing the growth of a virus or microbe and inactivate the endotoxin of gram-negative bacteria. The protegrins are particularly useful for the treatment of sexually transmitted trachomatis, Treponema pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the

The present supraetice is a special communication of the process of the combinantly produced, corresponding to the generic formula:

A1-A2-A3-A4-A5-Cys-A7-Cys-A9-A10-A11-A12-Cys-A14-Cys-A16-(A17-A18)

Where A1 = a basic amino acid; A2 and A3 = a small amino acid; A4 = a

Basic or small amino acid; A5, A7 and A14 = a hydrophobic amino acid;
A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino

acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino

acid; A10 and A11 = a basic, hydrophobic, neutral/polar,

hydrophobic or small amino acid; and A18 may be absent or a basic,

neutral/polar, hydrophobic or small amino acid. This has a charge of

cleast +3 and its N-terminal acylated and/or C-terminal amidated or

sterified forms, all of which may contain a disulphide bond to give a

cysteine bridge. Peptides of this formula are designated protegrins and

sterified forms, all of which may contain a disulphide bond to give a

cysteine bridge. Peptides of this formula are designated protegrins and

are settled an implants by preventing the growth of a virus or microbe

are particularly useful for the treatment of sexually transmitted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   disease caused by microorganisms e.g. Candida albicans, HIV-1, Chlamydia trachomatis, Treponema pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food. The protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antibiotics and are non-toxic to the cells of higher organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The present sequence is a specifically claimed example of a peptide, recombinantly produced, corresponding to the generic formula:

A1-A3-A4-A4-C4y-A3-A10-A11-A12-Cys-A14-Cys-A16-A17-A18)

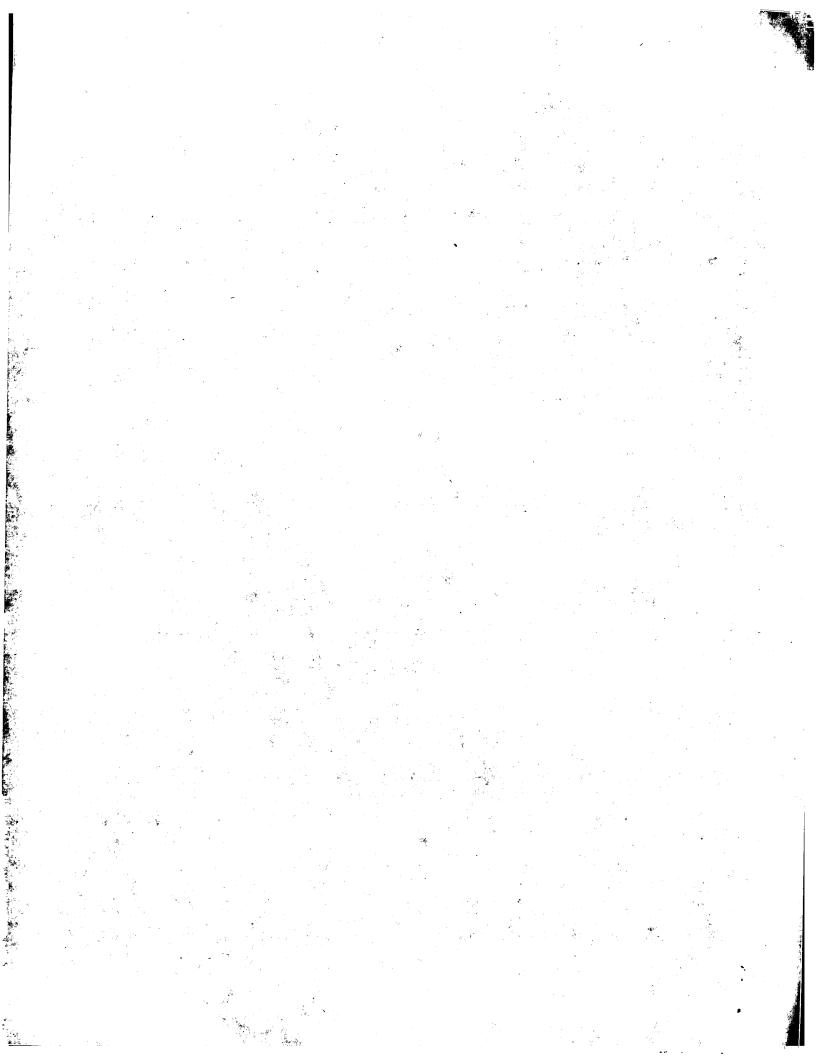

where A1 = a basic amino acid; A2 and A3 = a small amino acid; A4 = a basic amino acid; A5, A7 and A14 = a hydrophobic amino acid; A9, A12 and A16 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar or small amino acid; A10 and A11 = a basic, hydrophobic, neutral/polar, bydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and A18 may be absent or a basic, neutral/polar, hydrophobic or small amino acid; and instituted or small and and and acidited protection and anti-bacterial, anti-viral and anti-fungal agents in viral infection in plants by preventing the growth of a virus or microbe and inactivate the endotoxin of gram-negative bacteria. The protegrins are aperticularly useful for the treatment of sexually transmitted alsease caused by microcramisms e.g. Candida albicans, HIV-1, Chlamydia trachomatis, Treponema pallidum and Neisseria gonorrhoeae. They can also be used in eye care solutions and as preservatives for food. The the protegrins are more effective under physiological conditions (e.g. in the presence of serum) than certain antiblodical conditions (e.g. in the presence of serum) than certain antiblodical conditions (e.g. in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cationic, antimicrobial, virus-neutralising protegrin peptide(s) useful for the treatment of microbial infection, as food preservatives and in eye care solutions

"Cloning and molecular analysis of genes affecting expression of
binding substance, the recipient-encoded receptor(s) mediating mating
binding substance, the recipient-encoded receptor(s) mediating mating
J. Bacteriol. 175:7421-7429(1993).

-!- CATALYTIC ACTIVITY: 3-DEHYDROQUINATE = 3-DEHYDROSHIKIMATE + H(2)O.
-!- PATHWAY: THIRD STEP IN THE BIOSYNTHESIS OF CHORISMATE WITHIN
THE BIOSYNTHESIS OF AROMATIC AMINO ACIDS (THE SHIKIMATE PATHWAY).
-!- SIMILARITY: BELONGS TO THE TYPE-I 3-DEHYDROQUINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20-AUG-2001 (Rel. 40, Created)

-!- SUBCELLULAR LOCATION: LOOSELY BOUND TO THE INNER THYLAKOID MEMBRANE SURFACE IN CHLOMPLASTS.
-!- SIMILARITY: THERE ARE 12 DIFFERENCES BETWEEN THE SEQUENCE OF POPLAR PLASTOCYANINS A AND B.
-!- SIMILARITY: CONTAINS 1 PLASTOCYANIN-LIKE DOMAIN.

PHENYLALANYL-TRNA SYNTHETASE BETA CHAIN (EC 6.1.1.20) (PHENYLALANINE--
Deckert G., Warren P.V., Gaasterland T., Young W.G., Lenox A.L., Graham D.E., Overbeek R., Snead M.A., Keller M., Aujay M., Huber R., Feldman R.A., Short J.M., Olson G.J., Swanson R.V.; "The complete genome of the hyperthermophilic bacterium Aquifex
                                                                                                                   Nature 392:353-358(1998).

1- CATALYTIC ACTIVITY: ATP + L-ISOLEUCINE + TRNA(ILE) = AMP +
PYROPHOSPHATE + L-ISOLEUCYL-TRNA(ILE).

1- COFACTOR: BINDS ONE ZINC ION (BY SIMILARITY).

1- SUBUNIT: MONOMER (BY SIMILARITY).

1- SUBCELLULAR LOCATION: CYTOPLASMIC.

1- SIMILARITY: BELONGS TO CLASS-I AMINOACYL-TRNA SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

1-2 DISEASE: A DEFICIENCY IN THE RYANODINE RECEPTOR MAY BE THE CAUSE OF MALICHANTY TYPERTHERMIA (MH) AND OF CEMTRAL CORE DISEASE OF MUSCLE (CCD). MH IS AN AUTOSOMAL DOMINANT DISORDER OF SKELETAL MUSCLE (ADD). MH IS AN AUTOSOMAL DOMINANT DISORDER OF SKELETAL MUSCLE AND IS ONE OF THE MAIN CAUSES OF DEATH DUE TO ANESTHESIA. COMMONIX USED INHALATIONAL ANESTHETICS SOCH AS LALOTHANE AND BY DEPOLARIZING MUSCLE RELAXANTS SUCH AS SUCCINYLCHOLINE. THE CLINICAL FEATURES OF THE MYOPATHY ARE HYPERTHERMIA, ACCELERATED MUSCLE METABOLISM, CONTRACTURES. METABOLIC ACTIONSIS, TACHYCARDIA AND DEATH, IF NOT TREATED WITH THE POSTSYNAPTIC MUSCLE RELAXANT, VITRO" CONTRACTURE TEST (IVCT): OBSERVING THE MAGNITUDE OF CONTRACTURE INDUCED IN STRIED OF MUSCLE IISSUE BY CAFFEINE ALONE AND HALOTHANE ALONE. PATIENTS WITH NORMAL RESPONSE ARE MH NORMAL (MHN), THOSE WITH ABRORMAL RESPONSE ALONE OR HALOTHANE ALONE ARE MH EQUIVOCAL (MHE(C) AND MEH(H) RESPONSE ARE MH NORMAL ALONE ARE MH EQUIVOCAL (MHE(C) AND MEH(H) RESPECTIVELY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WEDLINE-20081079; Pubmed-10612851;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

DNA-binding protein WRKY3 homolog F3L17.120 - Arabidopsis thaliana C; Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 16-Jul-1999 #sequence_revision 16-Jul-1999 #text_change 15-Oct-1999
C;Accession: T10685
R;Bevan, M.; Murphy, G.; Ridley, P.; Hudson, S.; Bancroft, I.; Mewes, H.W.; Mayer, K. submitted to the Protein Sequence Database, June 1999
A;Recerence number: 216652
A;Accession: T10685
A;Molecule type: DNA
A;Residues: 1-324 <BEV>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A;Cross-references: EMBL:AL080283; GSPDB:GN00062; ATSP:F3L17.120

This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism, e.g. therapeutic proteins, antibodies for their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                               100.0%; Score 89; DB 20;

This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family wheih contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
Linear; protegrin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm; nucleus; blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Derivatives of antibiotic peptides lacking disulfide bridges as carriers to deliver active agents into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Kaczorek M;

By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the P-glycoprotein pump, are avoided. Also, peptides are easily produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                    New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are linear and lack the agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonuclectides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; neurodegenerative; antidepressant; analgesic; antimicrobial; blod-brain barrier; diagnostic; central nervous system; protegrin; Antennapedia; tachyplesin; peptide antibiotic; Alzheimer's disease; cancer; Parkinson's disease; depression; pain; meningitis.

The invention relates to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous system. The linear peptide preferably has the formula: (a) X1-X16; (b); BXXBXXXXBBXXXXBBXXXXBBXB, where: each of X1-X16 are amino acids (aa), of which 6-10 of them are hydrophobic and X6 must correct forms of (a)-(c) containing a side chain that includes a basic group; and each X is an aliphatic or aromatic aa. The linear peptide may be cerver oforms of (a)-(c) containing D- and/or L-form aa, or a fragment containing at least 5, preferably at least 7 consecutive as from (a)-(c). Peptides able to cross the BBB include protegrins, Antennapedia, carciplessins, transportan, etc. Of these several families have cytolytic effects and are termed peptide antibiotics. They fall into 3 main caregories based on their structure: (i) peptides with alpha-halices, carcopins and maganins; (ii) peptides with disulphide bond-linked beta-sheets, e.g. protegrin, tachyplesins, defensins; (iii) peptides (a)-peptides continuing bends due to the presence of with no major structure but containing bends due to the presence of corresidues, e.g. bactericins and PR39. The peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on the BBB and is conjugated to a doxorubicin molecule by a succinate con linker. The peptide may also be linked to a benzylpenicillin molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conjugates of the linear peptides and the active agent are particularly used to treat, prevent or diagnose brain cancer, Alzheimer's or Parkinson's diseases, depression, pain and meningitis, but also for studying drug behaviour in BBB models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 51; DB 21; Length 18;

The invention relatices to the use of linear peptides, coupled to an active agent, to prepare a composition able the cross the blood-brain barrier for diagnosis or treatment of disorders localised in the central nervous (b); BXXBXXXBBBXXXXXXBX or (c) BXXBXXXBBXB, where: each of XI-XI6 are amino acids (aa), of which 6-10 of them are hydrophobic and X6 must can deach X is an aliphatic or aromatic a. The linear peptide may be retro forms of (a)-(c) containing a side chain that includes a basic group; containing at least 5, preferably at least 7 consecutive as from (a)-(c) containing D- and/or L-form aa, or a fragment containing at least 5, preferably at least 7 consecutive as from (a)-(c) reptides able to cross the BBB include protegrins, Antennapedia, tachyplesins, transportan, etc. of these several families have cytolytic tachyplesins, transportan, etc. of these several families have cytolytic effects and are termed peptide antibiotics. They fall into 3 main categories based on their structure: (i) peptides with alpha-helices, e.g. protegrin, tachyplesins, defensins; (ii) peptides with alpha-helices, beta-sheets, e.g. protegrin, tachyplesins, defensins; (iii) peptides containing bends due to the presence of the residues, e.g. protegrin, tachyplesins, defensins; (iii) peptides are based on the Antennapedia family peptides; (b)-peptides are based on the Antennapedia family peptides; (b)-peptides are based on terpresents a synthetic linear peptide designed on peptides and corresponded to a dalargin molecule by a disulphide linker. Conjugates of the linear peptide designed on peptides and pervent or diagnose brain cancer, Alzheimer's or conjugateses, prevent or diagnose brain cancer, Alzheimer's or studying drug behaviour in BBB models.
                                                                                                                                                               neurodegenerative; antidepressant; analgesic; antimicrobial;
                                                                                                                                                                            blood-brain barrier; diagnostic; central nervous system; protegrin; Antennapedia; tachyplesin; peptide antibiotic; Alzheimer's disease; cancer; Parkinson's disease; depression; pain; meningitis; dalargin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nseful for
                                                                                                                                                                                                                                                                                                                                                     /note= "cross-links to a molecule of dalargin via a disulphide linker"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of linear peptides as vectors for active ingredients, useful diagnosis and treatment of central nervous system diseases, can transport agents passively across the blood-brain barrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the use of linear peptides,
                                                                                                                    Protegrin-like peptide antibiotic Dal-SynBl.
                                                                                                                                                                                                                                                                                                                Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Temsamani J;

By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition useful for cancer treatment and prevention, contains anticancer agent and peptide vector that transports agent into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
